Project Introduction

Lake Cachuma is an artificial lake located in the Santa Ynez Valley in Santa Barbara County. The Lake is located on the Santa Ynez River adjoining California State Route 154. The reservoir was created by the construction of Bradbury Dam, a 201-foot earth structure built by the U.S. Bureau of Reclamation in 1953. The water from the Lake serves several cities downstream including Santa Ynez Valley and south coast as well as farming in the Lompoc area. Its surface area covers 3,100 acres with an original design capacity of 205,000 acre-feet. The Lake captures storm runoff from approximately 416 square miles of watershed area.

Executive Summary

The original projection for Lake Cachuma is for enough water to supply its customers for up to seven years. Surveys are performed periodically to verify that the capacity has not been diminished by sediment inflow or other factors. Surveys have been performed in the past in years 2000 and 2008. All three surveys show good overall correlation. At the lowest elevations, the surveys show a trend towards less surface area, typical of sediment deposition. However, the overall impact on reservoir storage is small. A greater difference is seen in the between years 2000 and 2008 than between 2008 and 2013.

The field survey methodology was to combine ground GPS field survey with bathymetric survey and aerial survey to provide complete coverage of the lake. The results of the survey have been completed and this report is intended to provide updated data for the storage capacity for Lake Cachuma and provide current data regarding sedimentation influx to the lake. Survey mapping was performed from the lowest point of the basin, at elevation 600 feet, up to the 757 foot elevation (NGVD 29); mapping was also performed north of the dam. We observed that that lake has lost some capacity. The primary volume impact is below elevation 610 (NGVD 29). Included are volume elevation and capacity which provide detailed information on storage capacity.

Survey Control

The field survey was derived from static observations and adjusted utilizing Online Position User service (OPUS) to NAD 88 horizontal datum and NAVD 88 vertical datum at points 20 and 35. The resulting values were inversed and field verified for data quality. These values were provided to the bathymetric survey crew for consistency. The survey team also measured key vertical control in NGVD 29 for preparing a project transformation and provided reports in NGVD 29 and NAVD 88 Datum. The remaining control consisted of aerial panels for aerial mapping and we worked closely with county staff for access and coordination with property owners. Panel locations were specified by C&C Aerial. Several panels required relocation due to onsite constraints including livestock and highway traffic. C&C's local presence allowed for direct communication and quick adjustment in the field. The panel values were provided to C&C, along with photos for each panel location. Wallace Group measured key spot elevations for verifying relative precision of Aerial Survey mapping. The ground survey was performed December 14 through 19, 2013. The Ground control panels for the flight were set using Trimble R-8 receivers. These receivers are state-of-the-art GPS units utilizing the Global Navigation Satellite System (GNSS). United States Bureau of Reclamation Water Level Recorder Benchmarks were observed for conversion to NGVD 29 datum.

Survey Base Point 35

Figure 3:

USBR Survey Benchmark=Elevation 758.09 feet (NGVD 29) Elevation=760.47 Observed (NAVD 88)

Aerial Survey

The project was flown on December 20, 2012 and airborne GPS was utilized to limit the necessary ground targets to 14. This reduced the number of private property access issues. The flying height was 3,875 feet ABL and the photo scale was 8.5cm Ground Sampling Distance (GSD). One hundred seventy six (176) stereo models were created from which the topographic data was measured and compiled.

Mapping

Contour mapping was performed from the bathymetric and aerial survey data from the lowest point in the reservoir of 601 feet to the crest of the dam at 760 feet (NAVD 88). A contour map was prepared showing the 2-foot contour interval.

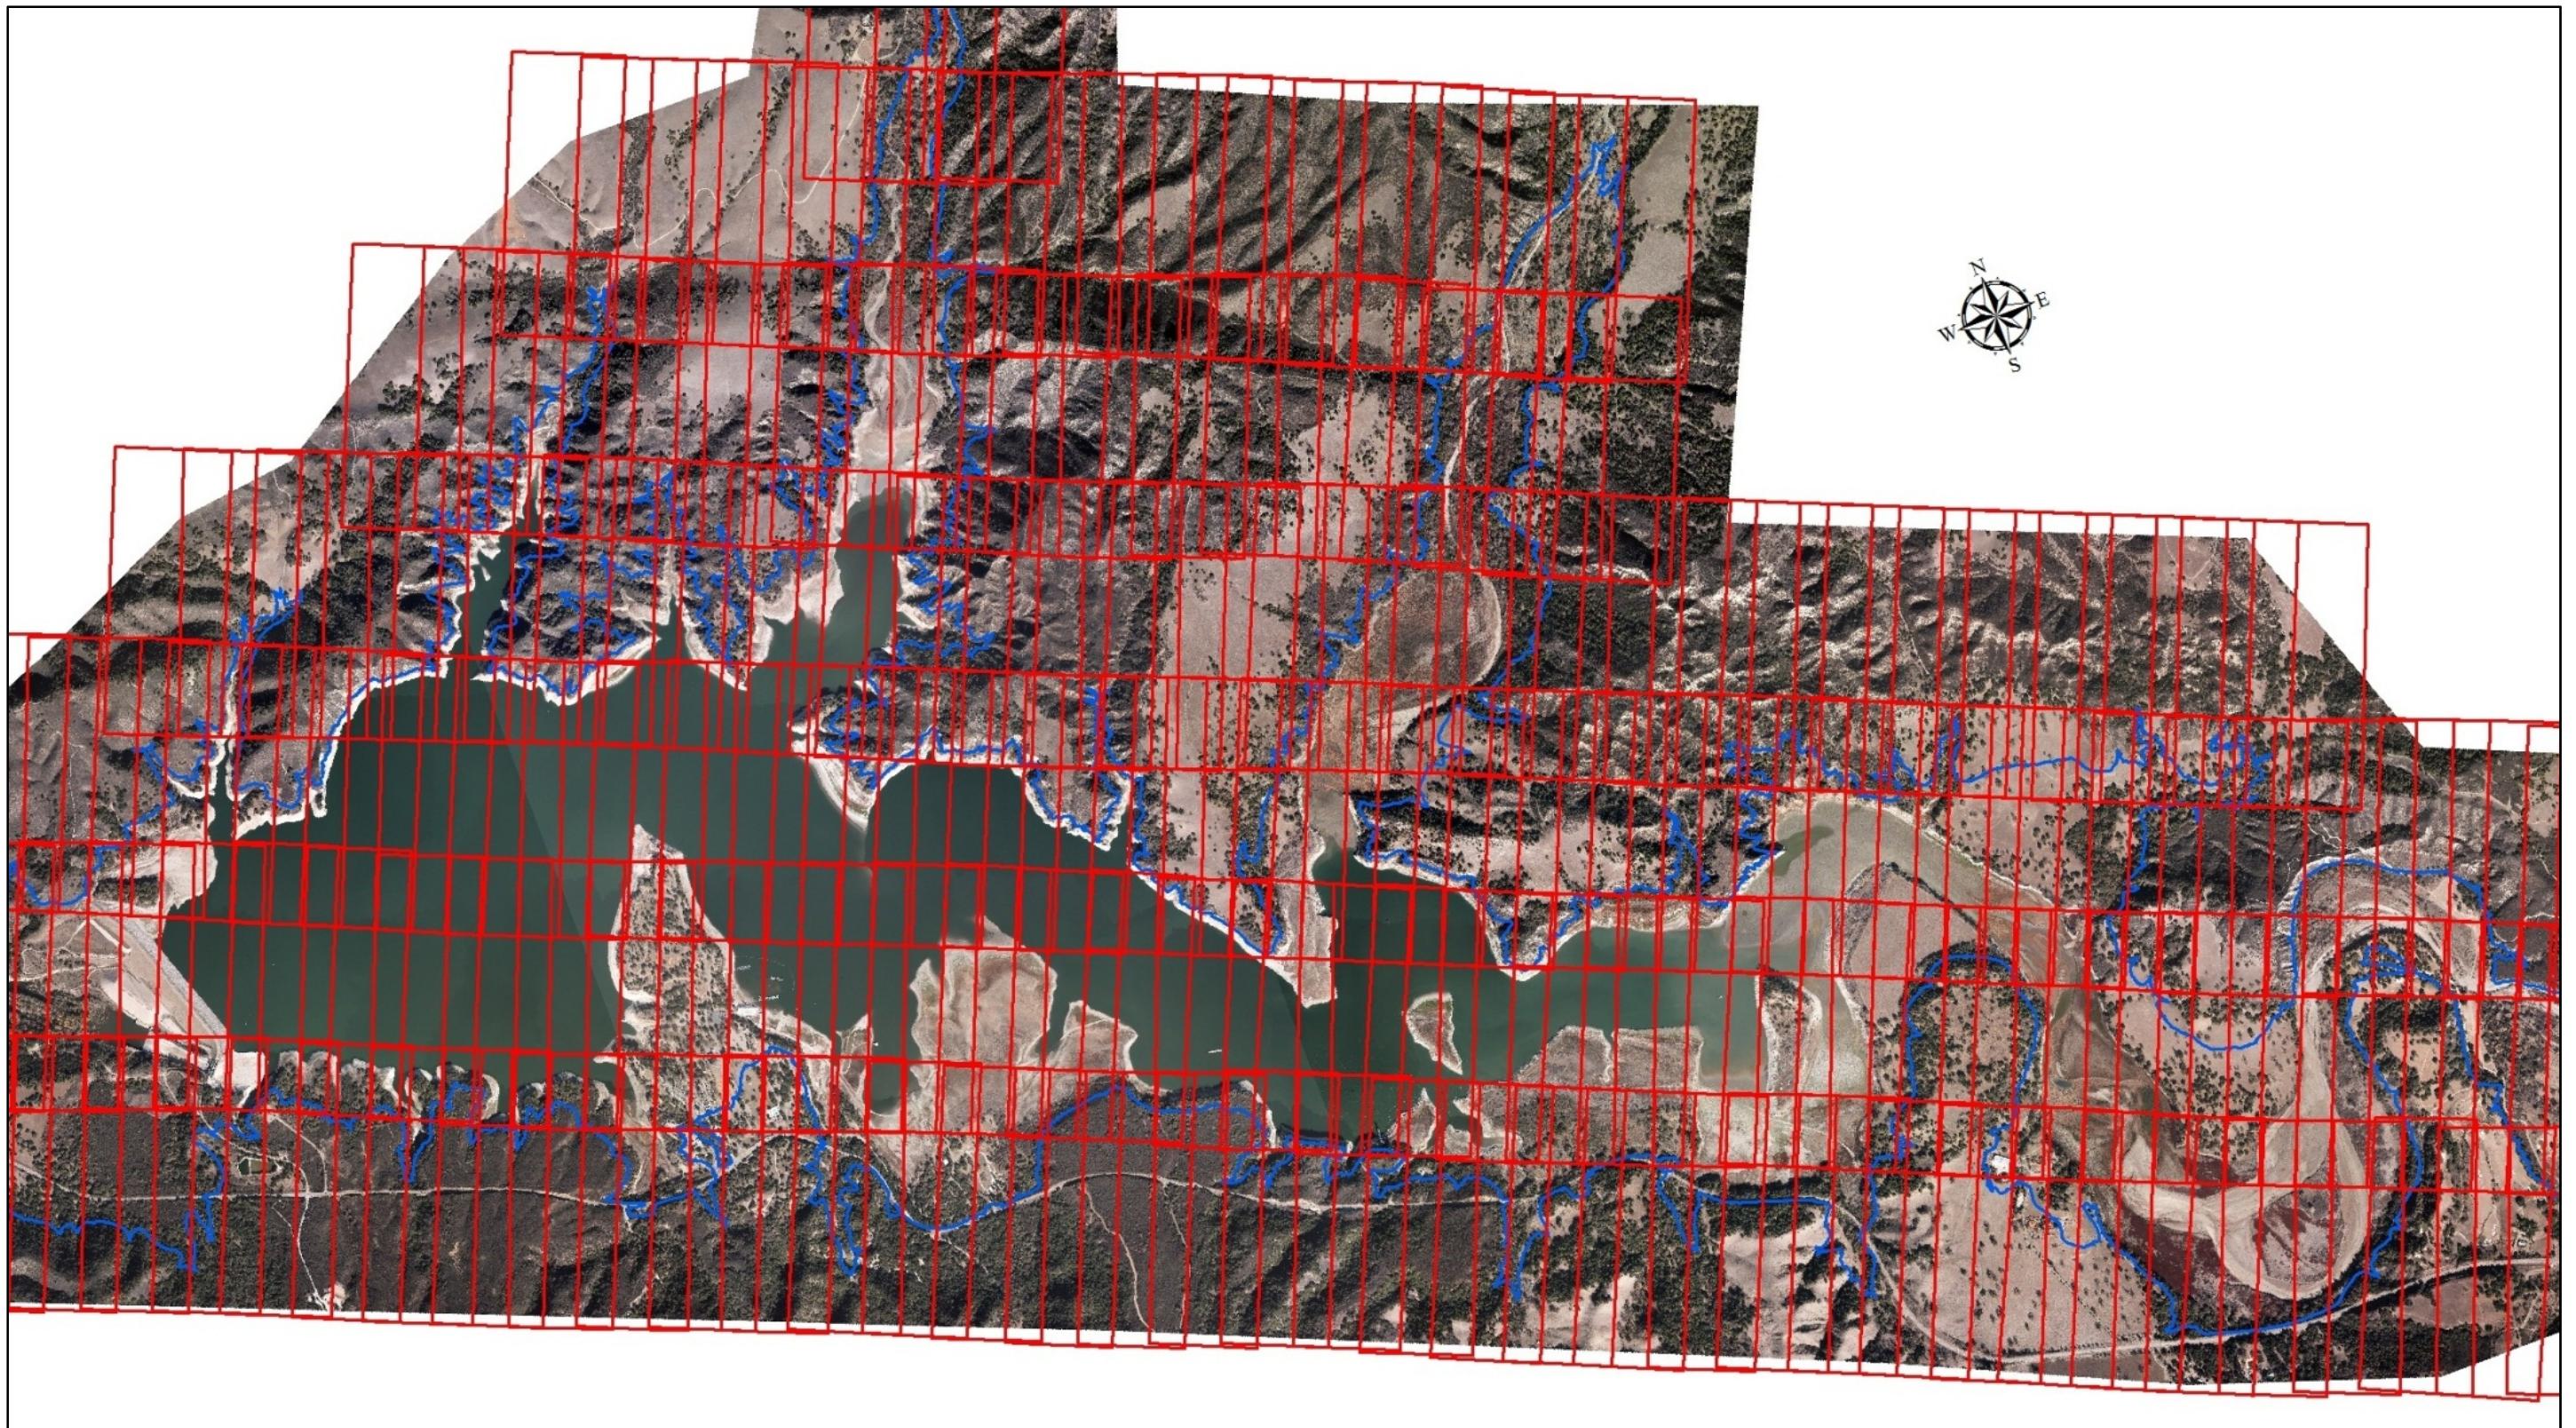

Figure 4:
Stereo Models overlaid on project limits; 176 models were compiled, mapping scale 1"=100ft, and 2ft contour intervals

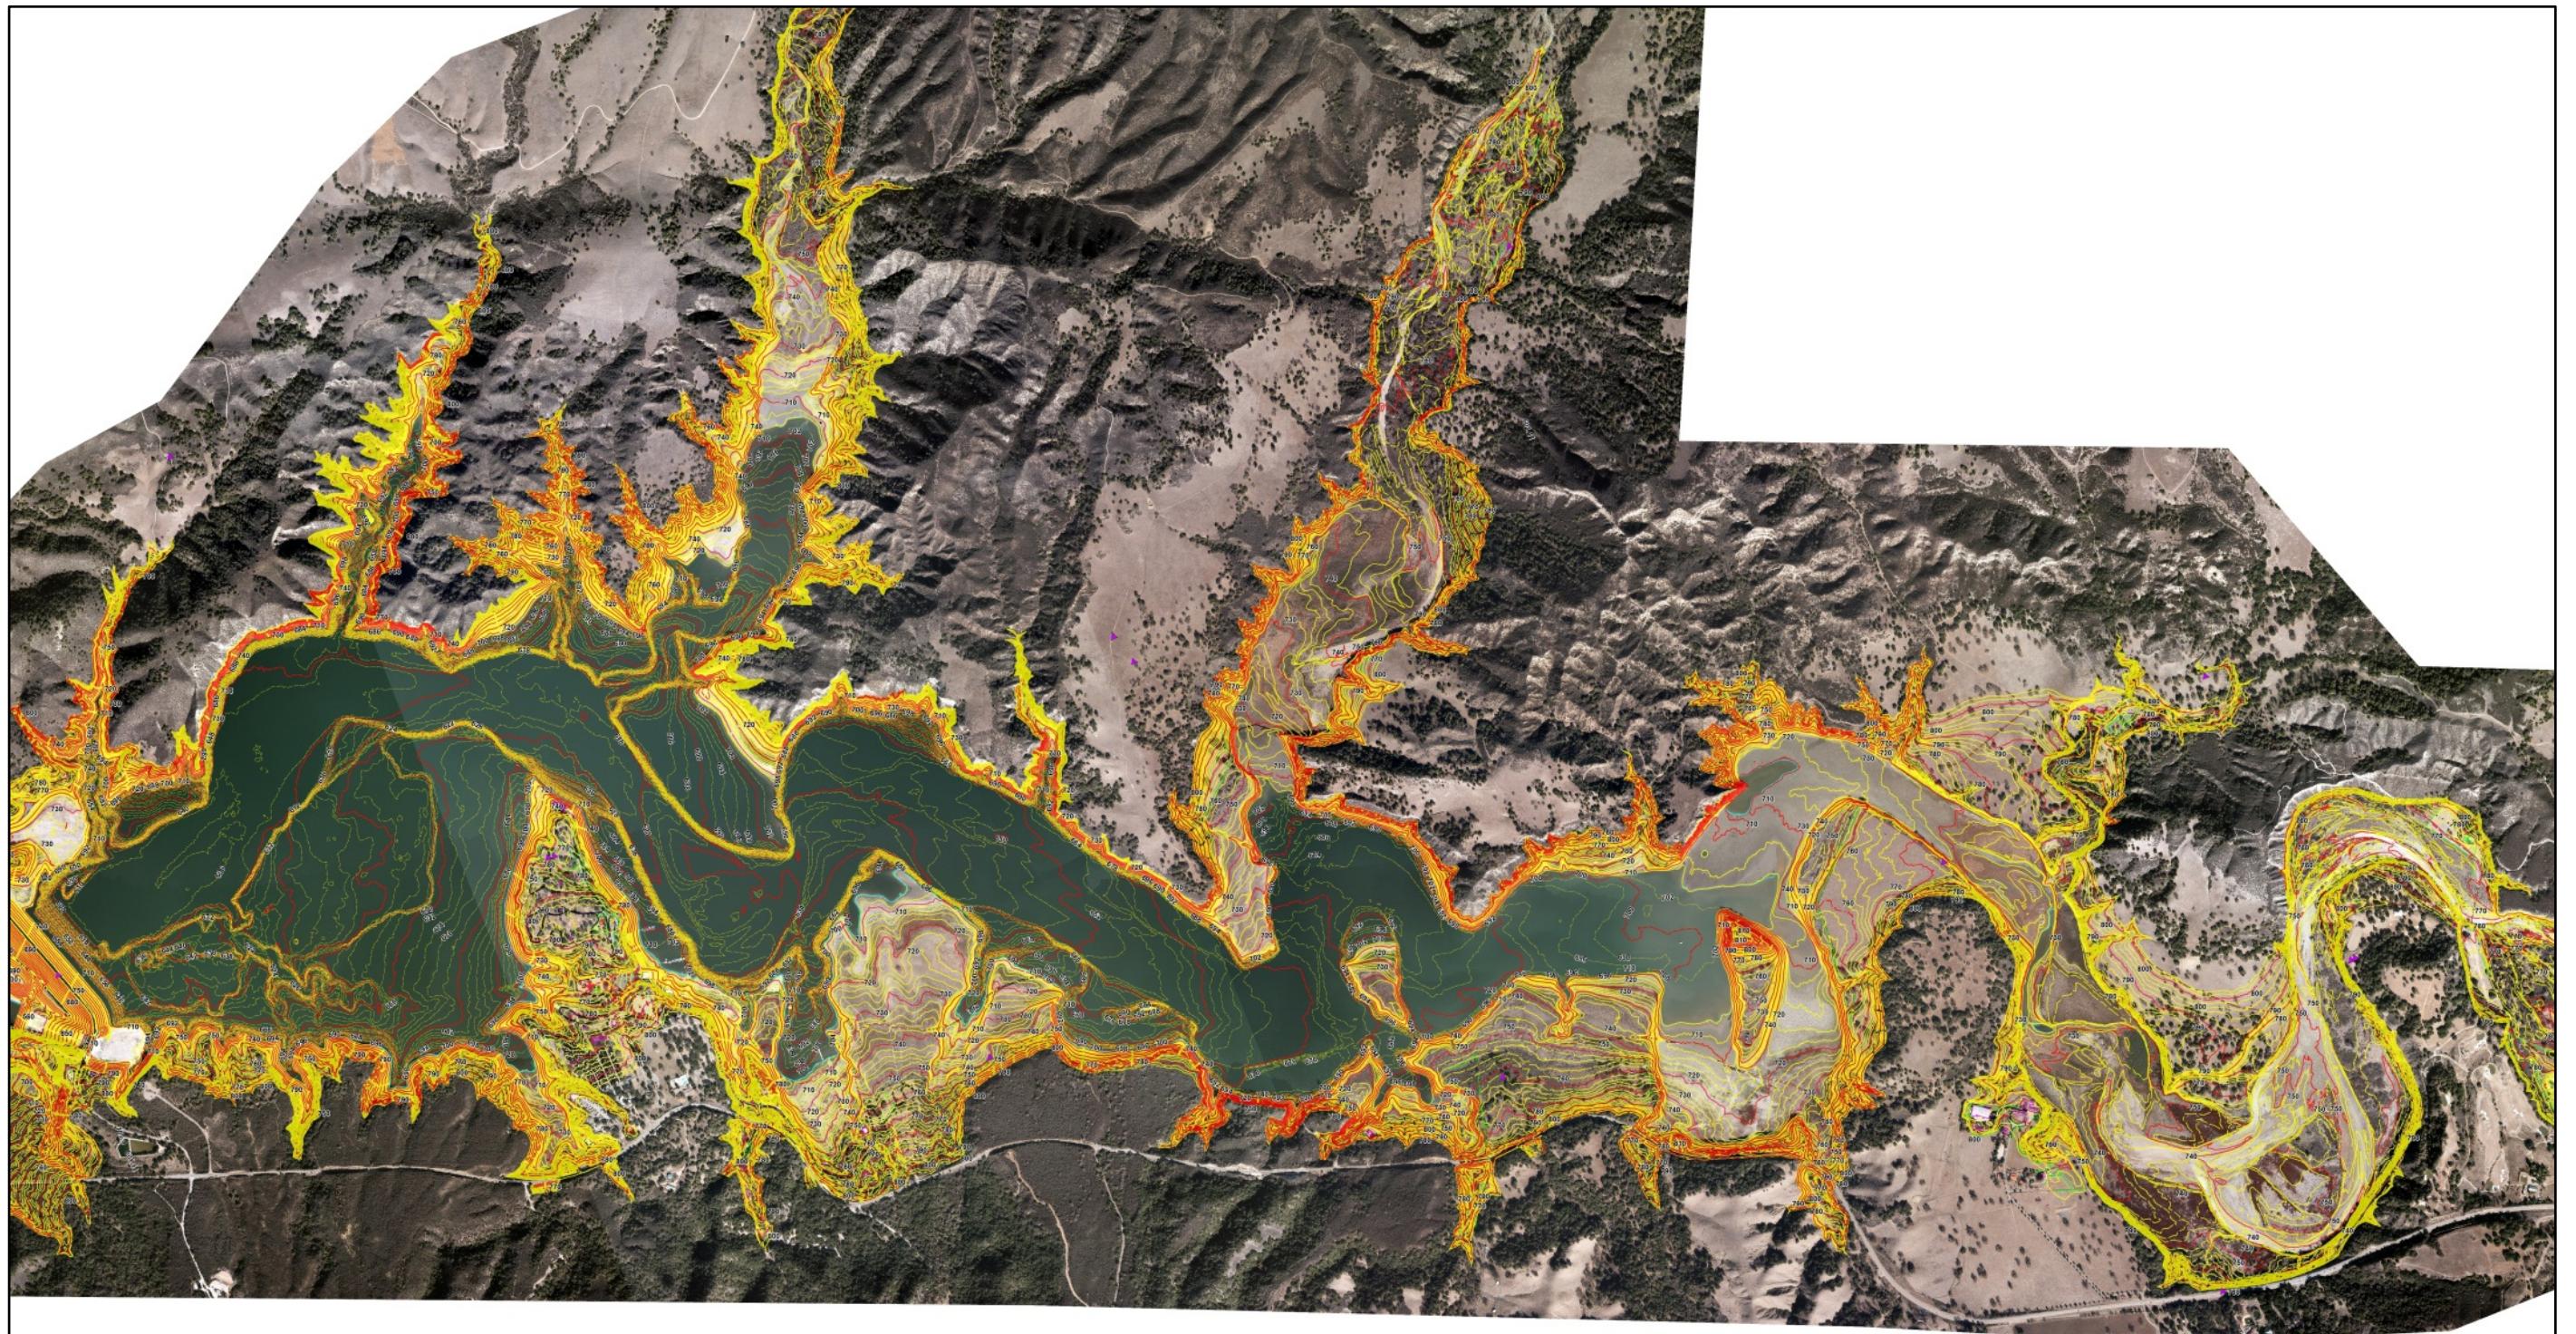

Figure 5
1000 Scale Contours

Bathymetric Survey

The survey was conducted using multi-beam and single-beam bathymetric survey technology along with RTK GPS positioning integrated with a computer navigation system.

Multi-beam bathymetry data was collected where water depths were 10 feet or more within the proposed survey area with a 27' survey vessel mobilized with an R2Sonic Multi-beam swath bathymetry system using precise Real Time Kinematic (RTK) GPS positioning. The RTK system was referenced to on shore survey control providing real-time vertical and horizontal positioning making the use of a water level gauge unnecessary.

In areas where water depths were 10ft or less a 17' skiff mobilized with an Odom CV100 single-beam bathymetry system using precise Real Time Kinematic (RTK) GPS positioning system as used for the multi-beam data acquisition phase. The multi-beam swath bathymetry system provided complete bottom coverage throughout the survey area where water depths were greater than 10 feet and single-beam coverage in water depths less than 10 feet. Survey line spacing and orientation for single-beam bathymetric data acquisition was determined and surveyed, with a minimum of 100 foot spacing between lines maintained with soundings at a minimum of one every foot. HYPACK was utilized for positioning and multi-beam/single-beam bathymetric data acquisition.

Figure 6: Survey Skiff

Water level data was determined from the RTK GPS system established near the survey area based on survey control. Using the RTK system provided water surface elevation, and the bathymetric survey provided depth of water continuously throughout the survey and eliminated inaccuracies associated with water level gauge measurements. Bathymetric Survey accuracies are as follows:

- Horizontal position accuracy at the surface was within a centimeter and values recorded to the hundredth of a foot.
- Vertical measurement accuracies were +- 0.2 ft. within water depths less than 20 feet and+- 0.5 ft. within water depths greater than 20 feet as stated in the USACE Hydrographic Manual EM 1110-2-1003 general criteria and accuracy estimates section.

The “ponded water” shown in Figure 7 was not measured during the bathymetric survey because the water depths were not sufficient for the skiff to be launched. The survey team worked closely with county staff to determine the necessity for measurement with several methods reviewed. Upon closer inspection it was determined that the area would be sufficiently covered from the aerial survey based on the minimal depth of the water, the flight height and accuracy required for the survey.

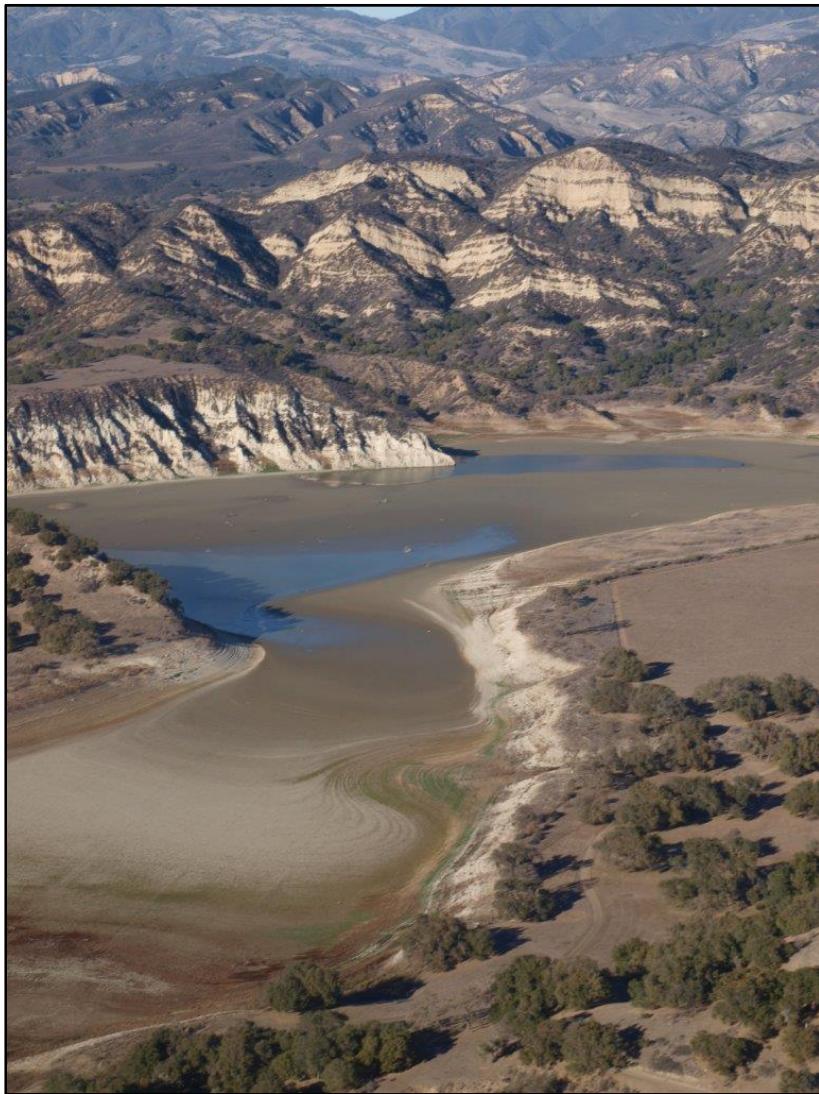

Figure 7:
“Ponded Water”

Mapping Volume Calculations

Wallace Group utilized GIS 3D Analyst for volume calculation. This software is well-suited to large amounts of data, and the mapping and images can be directly imported into County of Santa Barbara’s geodatabase for immediate access. A three-dimensional ground surface model of the reservoir was prepared using GIS 3D Analyst from which the water surface areas for each contour interval. The calculated areas were utilized in preparing tables showing Elevation and Capacity versus Elevation. The GIS software provided results for water surface area, and stored volume at 1-ft elevation intervals. From this data, tables were generated at 0.10 and 0.01 ft elevation intervals based on interpolations within the 1-ft interval data. The tables provide data from elevation 601 feet to 757 feet (NGVD 29) and 606 to 760 (NAVD 88).

Graphical and tabular comparisons to past (2000 and 2008) surveys were prepared. The comparisons show close correlation between the past and current surveys. At the lowest elevations, below elevation 605 (NGVD 29), reduced area is noted, which is consistent with sediment deposition. Because the volume below these low elevations is small, the impact on total reservoir volume is minimal.

At elevation 605, the current 2013 survey shows a volume about 16 acre-feet less than reported in 2008. At the design capacity elevation of 753 (NGVD 29), the current 2013 survey shows a volume about 2,273 acre-feet less than the 2008 survey, which is within approximately 1.1 percent of the total volume.

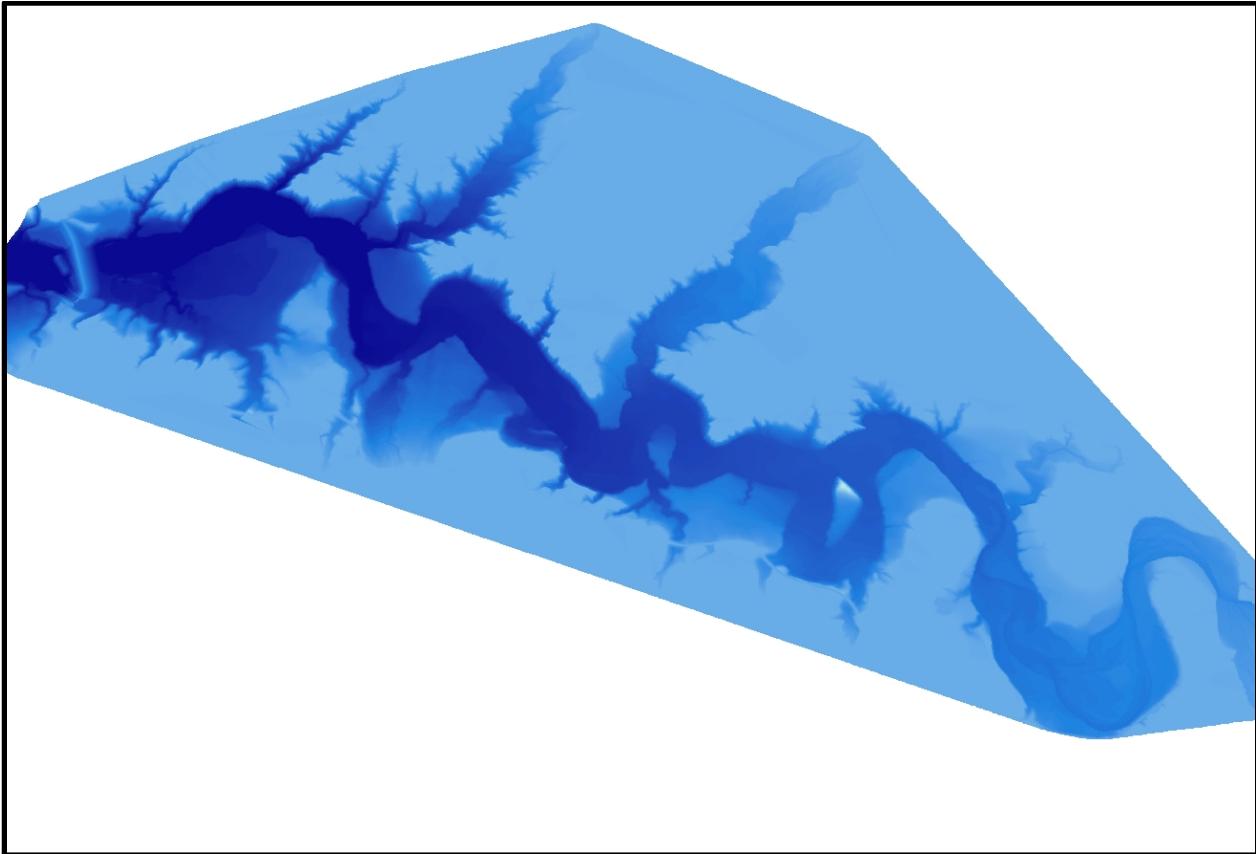

Figure 8:
Photo of GIS DTM

Property Boundaries

This survey effort did include a compilation or retracement of the District boundaries or other private property boundaries surrounding or including the reservoir. The following "Photo of Contacted Residences", Figure 9, is for reference only and was created from Assessor's Parcel data.

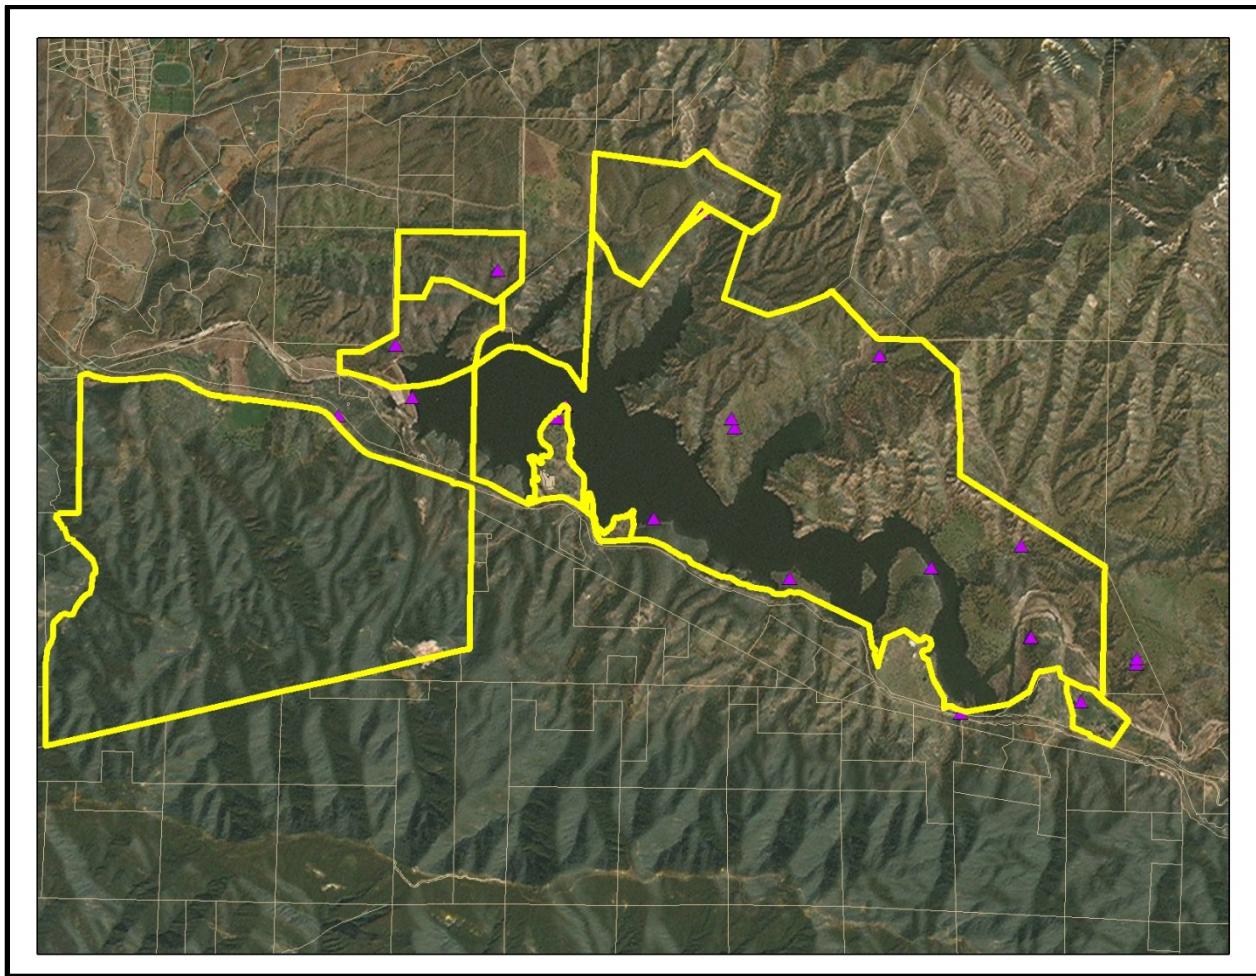

Figure 9:
Photo of Contacted Residences

Volume Study:

This report includes Area-Elevation and Capacity-Elevation Tables that calculate and report the area of the reservoir in acres, acre-feet and cumulative acre-feet in 0.10 ft. and 0.01 ft. increments of elevation from the lowest point on the reservoir to the dam crest. The table values were calculated using the areas and volumes derived from the GIS 3D Analyst software at 1-ft elevation increments, and intermediate values were determined by linear interpolation. Graphs were prepared which depict comparisons of volume to previous reports (Figure 10) and area comparisons (Figure 11). Both graphs reveal slight differences compared to the 2008 survey and except for the lowest portion of the area table which is most likely due to sediment deposition, they appear to be a result of the more accurate survey data.

Figure 10: Storage Volume Graph

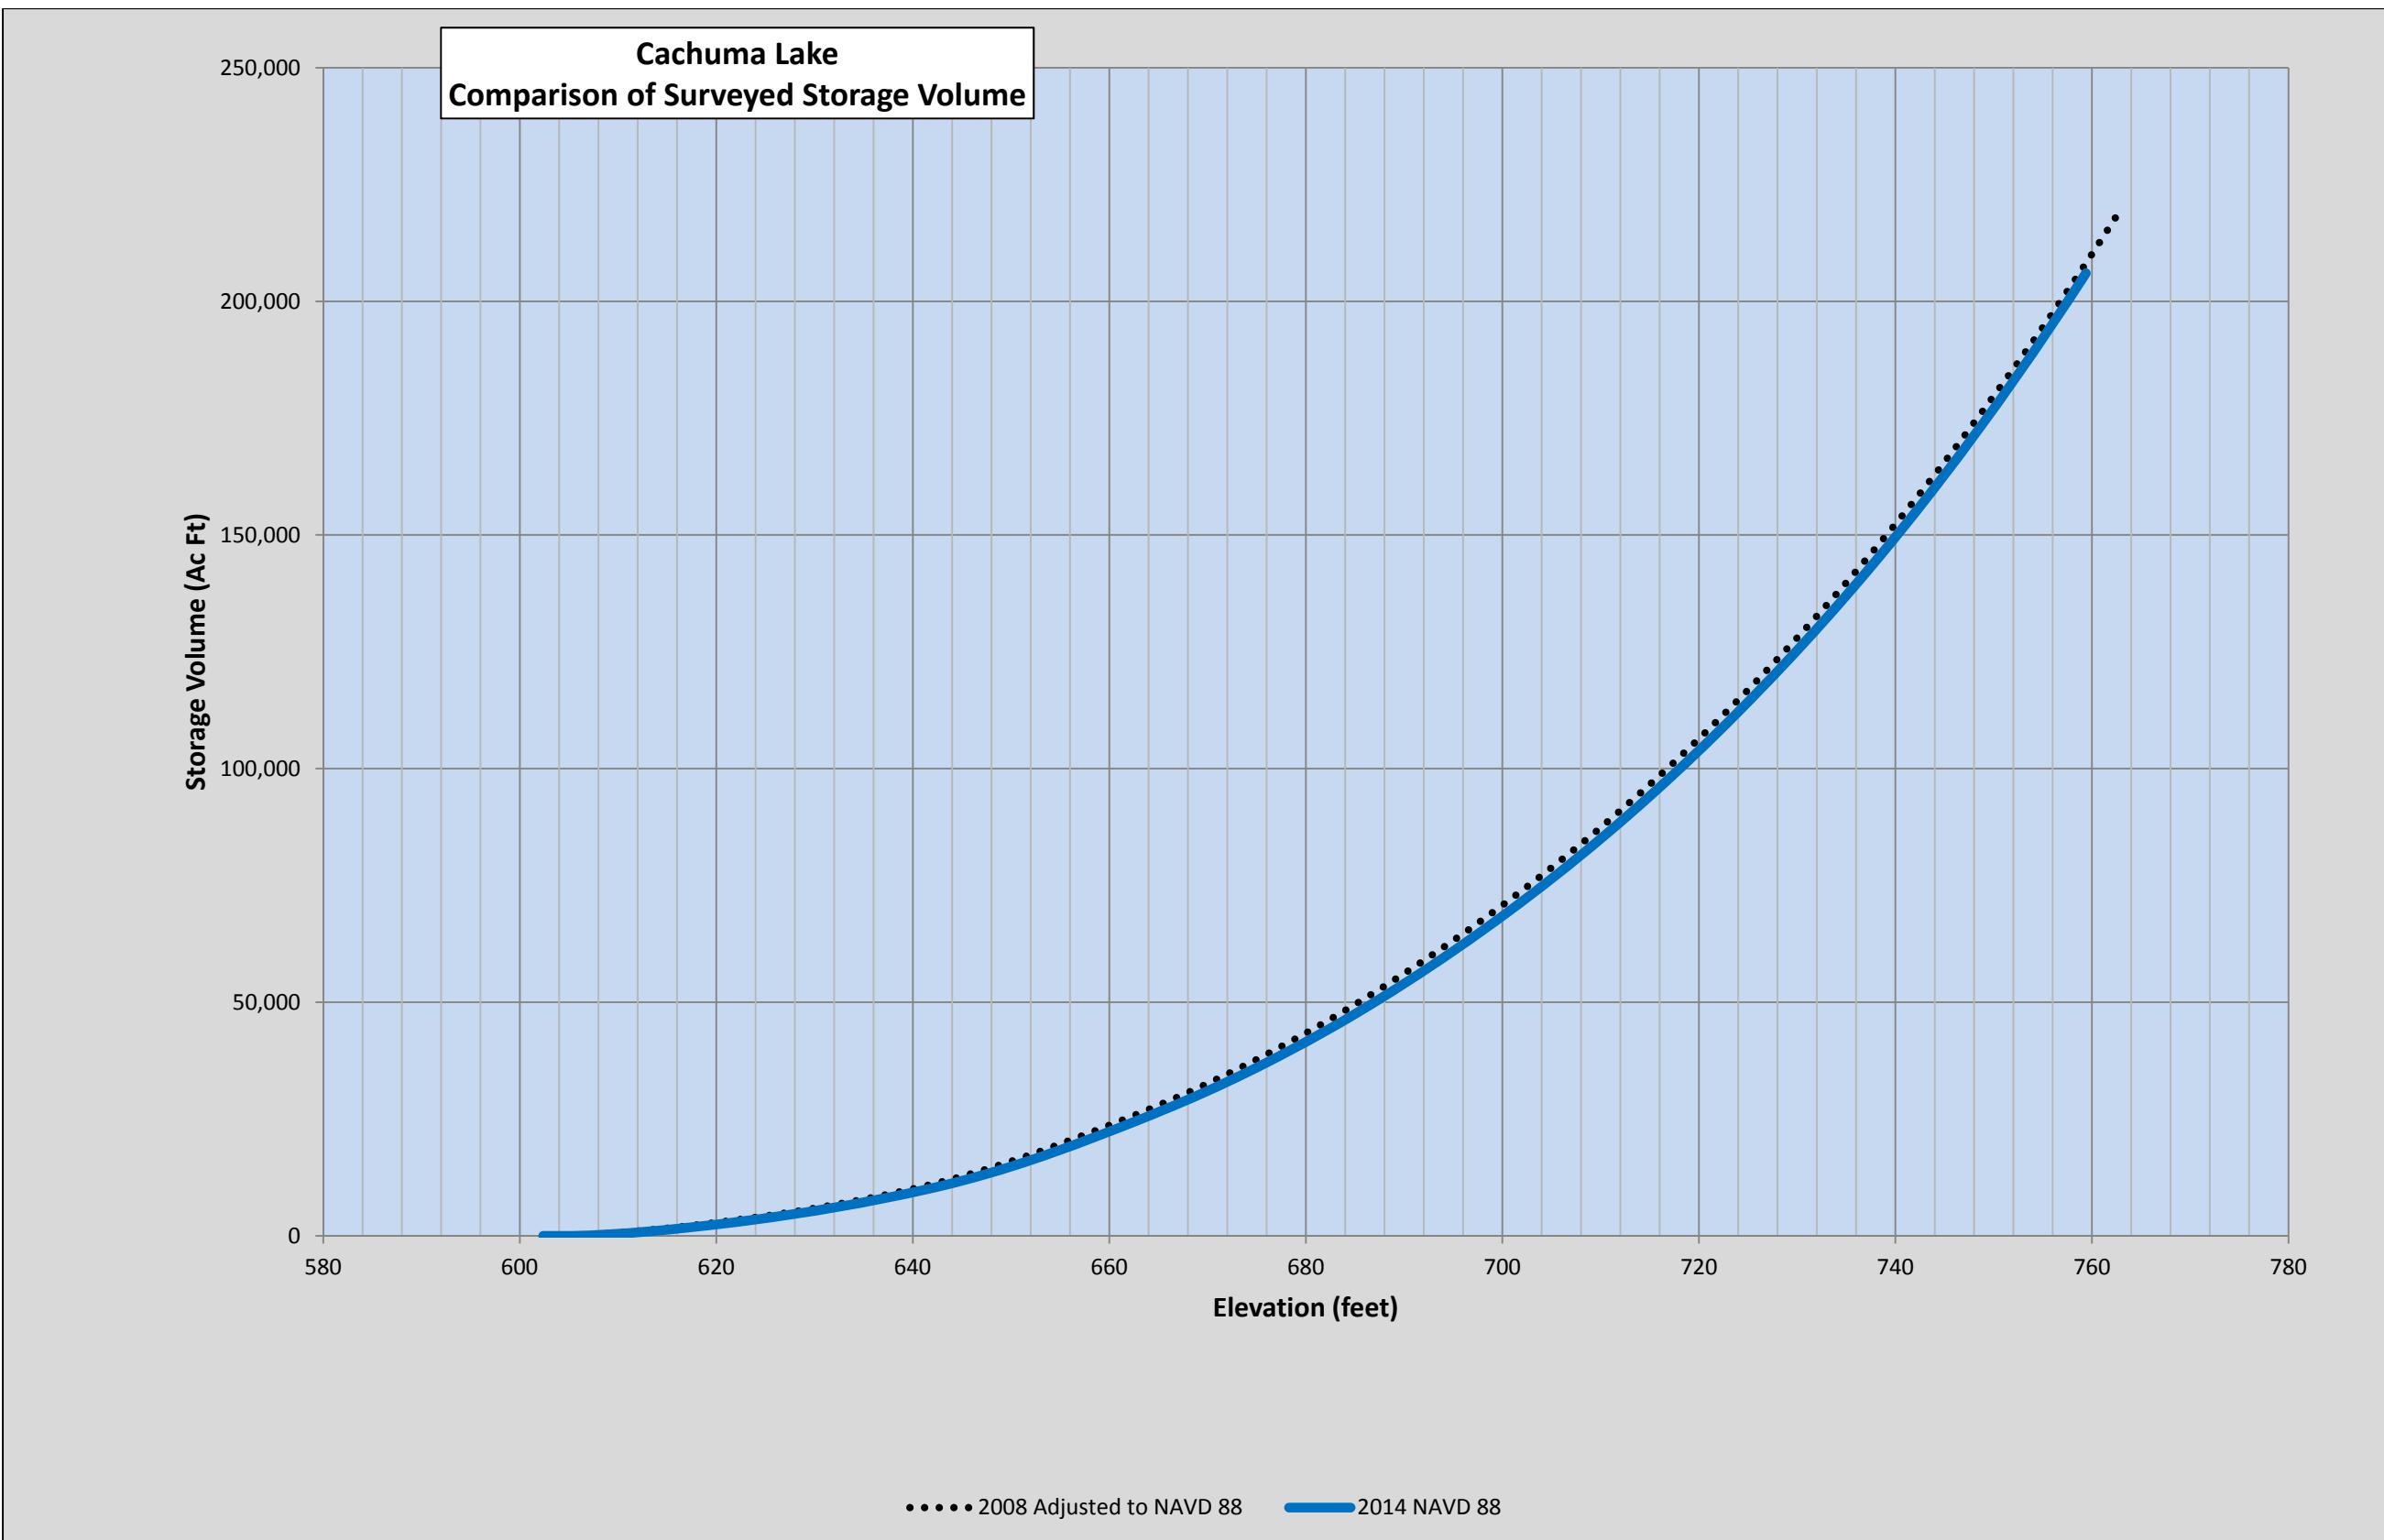

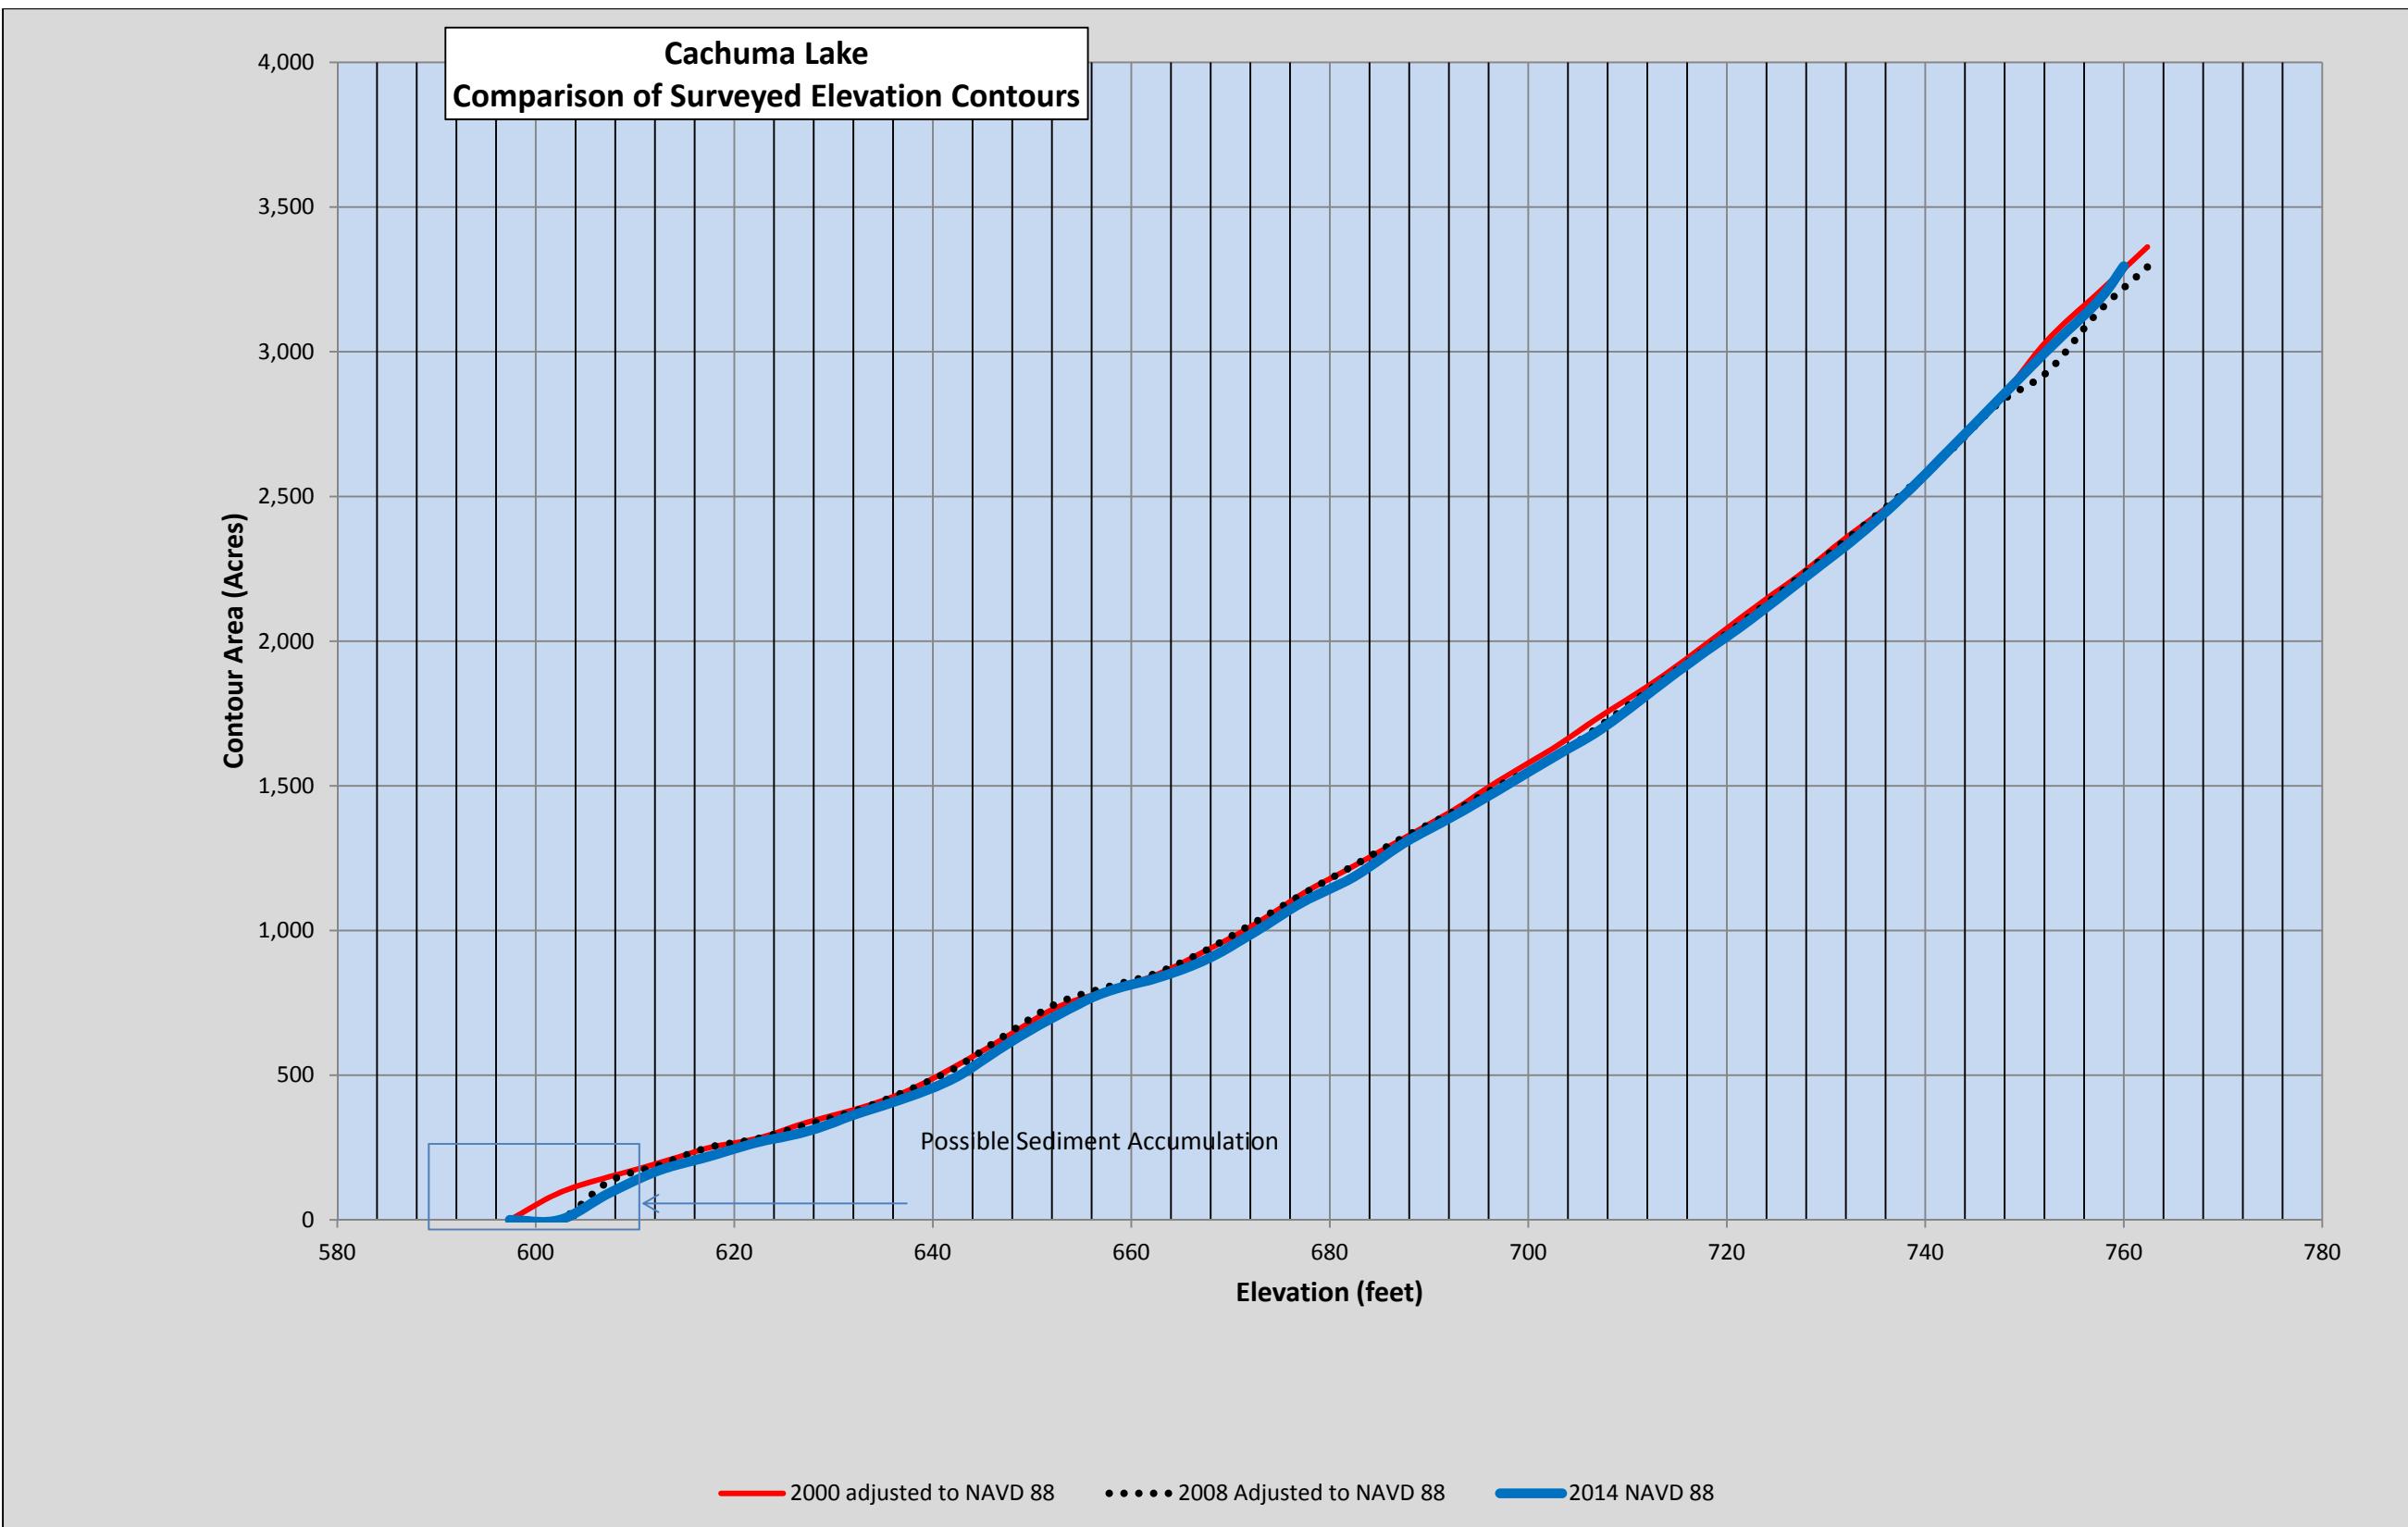

Figure 11: Surveyed Elevation Contours Graph

Observations and Conclusions:

The current survey (December 2013) was performed at a higher resolution than the previous surveys of Lake Cachuma. This was accomplished by flying the aerial at a lower elevation. The resulting topographic map was prepared with a contour accuracy of +/- 1 foot. This is the most accurate and detailed aerial survey for the reservoir to-date. The overall capacity of the reservoir has been reduced by 2,273 acre-feet resulting in a reduction of storage capacity of approximately 1.2% when compared with the 2008 survey. The capacity of Lake Cachuma was designed for 205,000 acre-feet of storage at an elevation of 750 (NGVD) in 1953 (normal water level). The current capacity at elevation 750 (NGVD 29) is 184,121 acre-feet resulting in a reduction of storage capacity of 11.3% when compared to the original design capacity. The current capacity is 193,304.8 acre-feet of storage at an elevation of 753 (NGVD). By studying capacities included in the report, we observed that majority of the variation appears to be related to survey accuracy and variance, with changes related to suspected sediment accumulations being minor and appears that a majority of those changes occurred below an elevation of 605 (NGVD 29), with a greater difference seen between years 2000 and 2008 than between 2008 and 2013.
